NEWS 1		Web Page URLs for STN Seminar Schedule - N. America
NEWS 2		"Ask CAS" for self-help around the clock
NEWS 3	Feb 24	PCTGEN now available on STN
NEWS 4	Feb 24	TEMA now available on STN
NEWS 5	Feb 26	NTIS now allows simultaneous left and right truncation
NEWS 6	Feb 26	PCTFULL now contains images
NEWS 7	Mar 04	SDI PACKAGE for monthly delivery of multifile SDI results
NEWS 8	Mar 24	PATDPAFULL now available on STN
NEWS 9	Mar 24	Additional information for trade-named substances without structures available in REGISTRY
NEWS 10	Apr 11	Display formats in DGENE enhanced
NEWS 11	Apr 14	MEDLINE Reload
NEWS 12	Apr 17	Polymer searching in REGISTRY enhanced
NEWS 13	Jun 13	Indexing from 1947 to 1956 added to records in CA/CAPLUS
NEWS 14	Apr 21	New current-awareness alert (SDI) frequency in WPIDS/WPINDEX/WPIX
NEWS 15	Apr 28	RDISCLOSURE now available on STN
NEWS 16	May 05	Pharmacokinetic information and systematic chemical names added to PHAR
NEWS 17	May 15	MEDLINE file segment of TOXCENTER reloaded
NEWS 18	May 15	Supporter information for ENCOMPPAT and ENCOMPLIT updated
NEWS 19	May 19	Simultaneous left and right truncation added to WSCA
NEWS 20	May 19	RAPRA enhanced with new search field, simultaneous left and right truncation
NEWS 21	Jun 06	Simultaneous left and right truncation added to CBNB
NEWS 22	Jun 06	PASCAL enhanced with additional data
NEWS 23	Jun 20	2003 edition of the FSTA Thesaurus is now available
NEWS 24	Jun 25	HSDB has been reloaded

NEWS EXPRESS	April 4 CURRENT WINDOWS VERSION IS V6.01a, CURRENT MACINTOSH VERSION IS V6.0b(ENG) AND V6.0Jb(JP), AND CURRENT DISCOVER FILE IS DATED 01 APRIL 2003

FILE 'REGISTRY' ENTERED AT 15:49:46 ON 15 JUL 2003
USE IS SUBJECT TO THE TERMS OF YOUR STN CUSTOMER AGREEMENT.
PLEASE SEE "HELP USAGETERMS" FOR DETAILS.

Property values tagged with IC are from the ZIC/VINITI data file
provided by InfoChem.

STRUCTURE FILE UPDATES: 14 JUL 2003 HIGHEST RN 548428-18-8
DICTIONARY FILE UPDATES: 14 JUL 2003 HIGHEST RN 548428-18-8

TSCA INFORMATION NOW CURRENT THROUGH JANUARY 6, 2003

Please note that search-term pricing does apply when
conducting SmartSELECT searches.

Crossover limits have been increased. See HELP CROSSOVER for details.

Experimental and calculated property data are now available. See HELP
PROPERTIES for more information. See STNote 27, Searching Properties
in the CAS Registry File, for complete details:

TI Behavioral effects of the diterpene sclareol glucol
AU Georgieva, Zh.; Uzunov, P.; Ognyanov, I.; Bantutova, M.
CS Bulg.
SO Problemi na Farmakologiyata (1986), 1, 24-32
CODEN: PRFAE9
DT Journal
LA Russian
CC 1-11 (Pharmacology)
AB In expts. on male mice and rats some behavioral effects of the diterpene sclareol glucol (SG) were studied. SG in higher doses (50, 100 mg/kg) enhanced the sensitivity to touch and pain, shortened the duration of hexobarbital **sleep**, stimulated exploratory behavior in rats in open field, exerted no anti-convulsive effect and increased the mortality from pentylenetetrazole seizures. In higher doses (300, 500, and 1000 mg/kg) SG induced seizures.

AB The calcium antagonistic properties of (+)-T-cadinol, some of its stereoisomers and related terpenes were investigated in both functional and radioligand binding studies, and the effects were compared with those of the dihydroxypyridine calcium antagonist (.+-.)-nimodipine. In the isolated rat aorta, the terpenes relaxed contractions induced by 60 mM K+ more potently than those induced by phenylephrine. (+)-T-cadinol and its stereoisomers were the most potent among the terpenes to relax K+-induced contractions, whereas they were approx. 10,000 times less potent than (.+-.)-nimodipine in this regard. Binding of the dihydropyridine radioligand [3H]-(+)-PN200-110 was studied on rat cerebral cortical membranes. Displacement and satn. studies indicated that (+)-T-cadinol caused a competitive inhibition of binding. The log Ki values for (+)-T-cadinol and (.+-.)-nimodipine from displacement studies (-4.7 and -9.2) corresponded with the log RC50 values for **relaxation** of K+-contracted rat aortas (-5.0 and -9.0). For the terpenes, there was a significant correlation ($P < 0.001$, rs = 0.89) between displacement of dihydropyridine binding and the ability to relax K+-induced contractions. The structures of three terpenes were chem. modified by blocking hydroxyl groups. The potency of these derivs., as well as the naturally occurring deriv. 2-oxo-T-cadinol, to relax K+-induced contractions was not correlated to the lipophilicity of the compds. Instead, other qualities appear to be of importance for the functional effects. The authors' results suggest that (+)-T-cadinol and related terpenes may represent a new chem. class of calcium antagonists, which interact with dihydropyridine binding sites on the voltage-operated calcium channels.

AB In expts. on male mice and rats some behavioral effects of the diterpene sclareol glucol (SG) were studied. SG in higher doses (50, 100 mg/kg) enhanced the sensitivity to touch and pain, shortened the duration of hexobarbital **sleep**, stimulated exploratory behavior in rats in open field, exerted no anti-convulsive effect and increased the mortality from pentylenetetrazole seizures. In higher doses (300, 500, and 1000 mg/kg) SG induced seizures.

AB   Disclosed are autonomic-controlling agents exerting sedative,
     sleep-inducing, and stress-relieving effects on humans regardless of
     differences among individuals in the sensitivity or preference to smell.
     These agents contain as the main active ingredient sesquiterpene alcs.
     having a b.p. of .gtoreq. 250.degree. under atm. pressure, in particular,
     cedrol.

PRAI JP 2001-234832		20010802		

AB The dentifrices contain (A) menthol (I) and (B) cedrene sesquiterpene alcs. such as cedrol or cedrenol at (A)/(B) wt. ratio 1:0.01-10. The dentifrices show **sleep**-inducing effect because cedrene sesquiterpene alcs. suppress awakening effect of menthol. The cedrene sesquiterpene alcs. do not inhibit awakening effect of menthol in a

parasympathicotonic state such as a time just after awakening. A dentifrice contg. l-I 0.3, peppermint oil 0.2, spearmint oil 0.2, cedrol 0.004, sorbitol 30.0, glycerin 18.0, CaCO3 15.0, SiO2 7.5, Na lauryl sulfate 1.2, CM-cellulose 1.2, propylene glycol 0.5%, and H2O balance significantly shortened time for falling asleep.

CC 1-5 (Pharmacodynamics)
AB When given i.v. or orally at .geq.100 mg/kg, synthetic farnesol [**4602-84-0**] (contg. a mixt. of stereoisomers) was a psychosedative in mice and rats. Except at high doses, farnesol did not inhibit psychomotor reactions (defense reflex), but it lowered the response to

psychic stimuli such as curiosity and caffeine-induced excitation. Farnesol did not cause catalepsy, nor did it antagonize pentetrazole-induced convulsion. It prolonged barbiturate **sleep** without itself being a hypnotic. Farnesol also had a musculotropic-type spasmolytic action on the isolated rat intestine and guinea pig sphincter of Oddi contracted by acetylcholine, $BaCl_2$, histamine, or serotonin.

AB The aim of this work was the synthesis of a natural pharmacol. active substance. The target compd. could be prepd. by an oxidative coupling reaction involving a starting material also found in nature. Eugenol, an allyl phenol widely used as a dental local anesthetic, was obtained by a soxhlet extn. of cloves oil from Caryophyllus aromaticus. Eugenol, prepd. by purifn. of the crude oil, was dimerized using potassium ferricyanide, giving dehydrodieugenol (DDE), a substance previously isolated from plants. The two phenolic groups were methylated with di-Me sulfate giving di-O-methyldehydrodieugenol (DMDDE). Pharmacol. evaluation of DMDDE in mice showed that it has a CNS-depressant effect, characterized by general sluggishness of the animal. It potentiated the **sleep** induced by sodium pentobarbital (which confirms its depressant activity) and also presented an analgesic effect after chem., mech. and thermal nociceptives stimulus. Furthermore, 50% of the exptl. animals were protected against pentylenetrazol-induced convulsion and survived. These data confirmed the

central depressant activity of DMDDE.

AB Me Eugenol, an essential oil fraction obtained from Caryophyllum aromaticus, caused central depressing effects with significant hypnotic and myorelaxing action in doses of 40 mg/kg, i.p., for rats and 5 mg/kg, i.v., for rabbits and dogs, rapid induction and satisfactory duration of **sleep** (118.4 s and 47.3 min resp.) in rats, and **sleep** time between 9-12 min in dogs. Anesthetic evolution in dogs was satisfactory, followed by rapid recovery and movement. Me eugenol (20 .mu.g/mL) reduced the atrial muscular cardiac force of contraction (50%) in 20 min. The addn. of Me eugenol to isolated rat diaphragm-nerve prepns. produced muscular contraction blockade under direct and indirect stimulation.

AB A ligroin ext. of nutmeg (Myristica fragrans) increased the duration of light and deep **sleep** in the young chicken. The presence of trimyristin [555-45-3] tended to increase the effect of the ext. The ext. did not contain detectable amts. of myristicin [607-91-0], elemicin [487-11-6], safrole [94-59-7], or eugenol [**97-53-0**], which either individually or collectively have been suggested to be the active agents of nutmeg.

CC 13-6 (Mammalian Biochemistry)
Section cross-reference(s): 62
AB The effect of olfactory stimulation with jasmin and its component chems. on pentobarbital **sleep** time was investigated using mice in order to det. which component of jasmin influences pentobarbital **sleep** time via olfactory stimulation. **Sleep** time was defined as the time elapsed between i.p. pentobarbital administration and the first time that the animal was able to spontaneously right itself. **Sleep**

time was significantly decreased by olfactory stimulation with jasmin, and also by one of the fractions obtained by fractional distn. at 150 .degree.C and 0.1 mmHg. The fraction which influenced the **sleep** time was found to consist of benzyl benzoate, isophytol, geranyl linalool, phytol and phytyl acetate, which were identified using gas chromatog. with mass and IR spectrometry. In expts. using authentic samples of these components, phytol significantly shortened the pentobarbital **sleep** time, while the others had no effect. Phytol is the component of jasmin which reduces the duration of pentobarbital-induced **sleep**.

ST **sleep** pentobarbital jasmin phytol drug interaction; olfactory system **sleep** pentobarbital jasmin phytol

CC   1-11 (Pharmacology)
AB   In expts. on male mice and rats some behavioral effects of the diterpene
     sclareol glucol (SG) were studied.  SG in higher doses (50, 100 mg/kg)
     enhanced the sensitivity to touch and pain, shortened the duration of
     hexobarbital sleep, stimulated exploratory behavior in rats in
     open field, exerted no anti-convulsive effect and increased the mortality
     from pentylenetetrazole seizures.  In higher doses (300, 500, and 1000
     mg/kg) SG induced seizures.

AB (-)-.alpha.-Bisabolol (I) [**23089-26-1**], a component of chamomile, inhibited the ulcer formation induced by indomethacin, alc., or **stress** in rats, and increased the rate of healing of ulcers caused by HOAc or heat cauterization of the stomach. The chamomile ext. Kamillosan also inhibited the occurrence of alc.-induced ulceration.

AB In a punished drinking test in rats sclareol glycol (SG) decreased the no. of punished responses (proconflict response) while diazepam had the opposite effect; SG antagonized the anticonflict response of diazepam. Post-training administration of SG in rats enhanced retention in active avoidance rank evaluated 24 h later. SG produced an increase in plasma ACTH and corticosterone levels in unstressed rats. The **stress** -induced increase in ACTH and corticosterone secretion was potentiated by SG. These data suggest that SG behaves as an anxiogenic, memory-facilitator and perhaps adaptogenic agent. The effects of SG may be mediated by different mechanisms of action (stimulation of adenylate cyclase or interaction with GABA-ergic and dopaminergic transmitter mechanisms).

AB In expts. on male mice and rats some behavioral effects of the diterpene sclareol glucol (SG) were studied. SG in higher doses (50, 100 mg/kg) enhanced the sensitivity to touch and pain, shortened the duration of hexobarbital **sleep**, stimulated exploratory behavior in rats in open field, exerted no anti-convulsive effect and increased the mortality from pentylenetetrazole seizures. In higher doses (300, 500, and 1000 mg/kg) SG induced seizures.

AB The effect of olfactory stimulation with jasmin and its component chems. on pentobarbital **sleep** time was investigated using mice in order to det. which component of jasmin influences pentobarbital **sleep** time via olfactory stimulation. **Sleep** time was defined as the time elapsed between i.p. pentobarbital administration and the first time that the animal was able to spontaneously right itself. **Sleep** time was significantly decreased by olfactory stimulation with jasmin, and also by one of the fractions obtained by fractional distn. at 150 .degree.C and 0.1 mmHg. The fraction which influenced the **sleep** time was found to consist of benzyl benzoate, isophytol, geranyl linalool, phytol and phytyl acetate, which were identified using gas chromatog. with mass and IR spectrometry. In expts. using authentic samples of these components, phytol significantly shortened the pentobarbital **sleep** time, while the others had no effect. Phytol is the component of jasmin which reduces the duration of pentobarbital-induced **sleep**.

AB The calcium antagonistic properties of (+)-T-cadinol, some of its stereoisomers and related terpenes were investigated in both functional and radioligand binding studies, and the effects were compared with those of the dihydroxypyridine calcium antagonist (.+-.)-nimodipine. In the isolated rat aorta, the terpenes relaxed contractions induced by 60 mM K+ more potently than those induced by phenylephrine. (+)-T-cadinol and its stereoisomers were the most potent among the terpenes to relax K+-induced contractions, whereas they were approx. 10,000 times less potent than (.+-.)-nimodipine in this regard. Binding of the dihydropyridine radioligand [3H]-(+)-PN200-110 was studied on rat cerebral cortical membranes. Displacement and satn. studies indicated that (+)-T-cadinol caused a competitive inhibition of binding. The log Ki values for (+)-T-cadinol and (.+-.)-nimodipine from displacement studies (-4.7 and -9.2) corresponded with the log RC50 values for **relaxation** of K+-contracted rat aortas (-5.0 and -9.0). For the terpenes, there was a significant correlation ($P < 0.001$, $rs = 0.89$) between displacement of dihydropyridine binding and the ability to relax K+-induced contractions. The structures of three terpenes were chem. modified by blocking hydroxyl groups. The potency of these derivs., as well as the naturally occurring deriv. 2-oxo-T-cadinol, to relax K+-induced contractions was not correlated to the lipophilicity of the compds. Instead, other qualities appear to be of importance for the functional effects. The authors' results suggest that (+)-T-cadinol and related terpenes may represent a new chem. class of calcium antagonists, which interact with dihydropyridine binding sites on the voltage-operated calcium channels.

AB The aim of this work was the synthesis of a natural pharmacol. active substance. The target compd. could be prepd. by an oxidative coupling reaction involving a starting material also found in nature. Eugenol, an allyl phenol widely used as a dental local anesthetic, was obtained by a soxhlet extn. of cloves oil from Caryophyllus aromaticus. Eugenol, prepd. by purifn. of the crude oil, was dimerized using potassium ferricyanide, giving dehydrodieugenol (DDE), a substance previously isolated from plants. The two phenolic groups were methylated with di-Me sulfate giving di-O-methyldehydrodieugenol (DMDDE). Pharmacol. evaluation of DMDDE in mice showed that it has a CNS-depressant effect, characterized by general sluggishness of the animal. It potentiated the **sleep** induced by sodium pentobarbital (which confirms its depressant activity) and also presented an analgesic effect after chem., mech. and thermal nociceptives stimulus. Furthermore, 50% of the exptl. animals were protected against pentylenetrazol-induced convulsion and survived. These data confirmed the central depressant activity of DMDDE.

AB Me Eugenol, an essential oil fraction obtained from Caryophyllum aromaticus, caused central depressing effects with significant hypnotic and myorelaxing action in doses of 40 mg/kg, i.p., for rats and 5 mg/kg, i.v., for rabbits and dogs, rapid induction and satisfactory duration of **sleep** (118.4 s and 47.3 min resp.) in rats, and **sleep** time between 9-12 min in dogs. Anesthetic evolution in dogs was satisfactory, followed by rapid recovery and movement. Me eugenol (20 .mu.g/mL) reduced the atrial muscular cardiac force of contraction (50%) in 20 min. The addn. of Me eugenol to isolated rat diaphragm-nerve prepns. produced muscular contraction blockade under direct and indirect stimulation.

AB In a punished drinking test in rats sclareol glycol (SG) decreased the no. of punished responses (proconflict response) while diazepam had the opposite effect; SG antagonized the anticonflict response of diazepam. Post-training administration of SG in rats enhanced retention in active avoidance rank evaluated 24 h later. SG produced an increase in plasma ACTH and corticosterone levels in unstressed rats. The **stress** -induced increase in ACTH and corticosterone secretion was potentiated by SG. These data suggest that SG behaves as an anxiogenic, memory-facilitator and perhaps adaptogenic agent. The effects of SG may be mediated by different mechanisms of action (stimulation of adenylate cyclase or interaction with GABA-ergic and dopaminergic transmitter mechanisms).

Q Q1 Q2

AB The title compds. [I; R = Q, Q1, Q2; R1-R3 = H, OH, alkanoyloxy, alkyl, alkoxy, provided that .gtoreq.2 .noteq. H; R4, R5 = H, OH, alkanoyloxy; m = 0, 1; n = 0-9], useful as antiulcer agents, were prepd. Hydroquinone in dioxane contg. BF3.Et2O was heated 1 h at 40.degree. with 3,7,11,15-tetramethyl-2-hexadecen-1-ol to give, after hydrolysis, 2-(3,7,11,15-tetramethyl-2-hexadecenyl)hydroquinone. At 100 mg/kg orally the latter gave 84.9% inhibition of **stress**-induced ulcers in male rats. A tablet was formulated contg. 2-[3,7(R),11(R),15-tetramethyl-2-hexadecenyl]hydroquinone 50, cryst. cellulose 50, cornstarch 30, lactose 17.8, hydroxypropylcellulose 0.2, and Mg stearate 2 mg.

ST isoprenoid deriv prepn antiulcer; phytylhydroquinone deriv prepn antiulcer; hydroquinone phytyl prepn antiulcer
